# Hello Sys Argv

`sys.argv` is a list of command line arguments passed to a Python script. The first element in this list is the script name itself, and the subsequent elements are the arguments passed to the script.

Understanding how to use `sys.argv` is fundamental for creating interactive scripts that can adapt their behavior based on the inputs they receive when executed.

## Task

Your task is to create a Python script named `hello_sys_argv.py` that:

1. Accepts a name as a command line argument.
2. Prints "Hello, [Name]!" to the console. If no name is provided, the script should default to "Hello, World!".

## Example Usage

```
> python hello_name.py Alice
Hello, Alice!

> python hello_name.py
Hello, World!
```

## To Submit

Submit a `.py` file containing your script.
